TITLE: **Journal of Abstracts "Geografiya" (Referativnyy zhurnal "Geografiya")**

PERIODICAL: **Izvestiya Akademii Nauk SSSR, Seriya Geograficheskaya, 1958, Nr 3, page 158 (USSR)**

ABSTRACT: The journal "Geografiya" is going to publish special booklets describing different parts of the USSR, Canada and Japan. Another publication will deal with the shipbuilding areas of the world. In 1956/57 the journal had already published the following booklets: "Ferrous Metallurgy in the Leading Capitalistic Countries and Their Raw Material Resources" by M.S. Rozin and Yu.V. Medvedkov; "Power Engineering in Capitalistic Countries" by O.V. Vitkovskiy; "Economic Resources in India and Their Utilization" by F.D. Yaroshenko; and others.

TITLE: New selective polymers

SOURCE: AN SSSR, Institut fizicheskoy khimii. Issledovaniye svoystv ionoobmennykh
materialov (Research on the properties of ion-exchange materials). Moscow. Izd-vo
Nauka, 1964, 104-107

TOPIC TAGS: formaldehyde resin, ion exchange resin, resin selectivity, phenylimino-
diacetic acid, phenylhydroxylamine

ABSTRACT: In order to collect more experimental data on the relation between structure
and selectivity, and extend the choice of available selective resins the authors prepared a
series of new, more effective formaldehyde resins containing various functional groups. The
resins were prepared by the copolymerization of α -aminophenylsulfonic acid with formaldehyde.

TITLE: Results of clinical and physiological investigations of the crew of the first multiman Voskhod spacecraft [Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24 to 27 May 1966]
SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 34-36

TOPIC TAGS: space medicine, space physiology, weightlessness, bodily fatigue, stress reaction, combined stress, cardiovascular system, central nervous system, manned spaceflight/Voskhod-1

ABSTRACT: The inclusion of a physician in the crew of the Voskhod-1 made it possible to increase medical investigations of the crew members during flight and to compare them with results of preflight and postflight examinations. The scope of the physiological examinations was selected in order to obtain a more complete evaluation of the functional condition of the cardiovascular and central nervous systems, and the function of

Card 1/4

L 08269-67
ACC NR: AT6036480

external respiration of the cosmonauts. Physical exercises and orthostatic tests were included to detect earlier signs of physiological shifts.

Examinations were carried out before and after training in the ship, where certain conditions of flight were simulated, and also two weeks before flight. Postflight examination was begun fifteen minutes after landing and was continued for the first four days after the flight and also two weeks later.

After landing, the cosmonauts were active, looked somewhat excited, and complained of general fatigue. They were found to have hyperemia of the mucosa of the upper respiratory tract and conjunctivitis.

Komarov's weight dropped by 2.6%, Feoktistov's weight dropped by 4%, and Yegorov's by 3.9%. Weight loss was determined by Zhdanov to be due to water and fat loss. Neurological examination revealed a light swaying in the Romberg position, a tremor of the fingers, and increased perspiration. In addition, Yegorov showed a contraction of the retinal arteries. Disruption of vision and vestibular difficulties were not noted. Changes in EEG indicated an increase in inhibitory processes in the cortex of the brain. A diminution in work capacity was established by

Card 2/4

I, 08269-67

ACC NR: AT6036480

ing ship, there is reason to attribute them to limitation of motor activity under conditions of weightlessness. The functional shifts found after flight are indications of a general fatigue, a moderate stress reaction, and a certain amount of detraining. In general, the changes observed in the cosmonauts were of one type. The differences found between the cosmonauts can be attributed to individual differences. [W.A. No. 22; ATD Report 66-116]

TITLE: Problems of the selection of candidates for special crews [Paper presented at conference on problems of space medicine held in Moscow from 24-27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 81-83

TOPIC TAGS: cosmonaut selection, bioastronautics, space physiology, space psychology, psychophysiology, cosmonaut training

ABSTRACT: The systematic exposure of young test pilots to aviation or space-flight conditions is of importance relative to perfecting methods for selecting pilots and cosmonauts. Considering the caliber of professional activity, the test pilot must be in excellent physical and mental condition.

Selection takes place in three stages: preliminary ambulatory selection, stationary examination in special medical establishments, and elimination during the first months of occupational activity.

Card 1/3

L 11364-67

ACC NR: AT6036509

During preliminary selection, the medical commission was given documents describing anamnesis data, general and physical development, and medical treatment in the preceding year. After familiarization with these documents, nearly half the applicants were rejected due to therapeutic status or poor eyesight. During preliminary ambulatory examinations, medical specialists (therapists, otolaryngologists, neuropathologists, surgeons) analyzed blood, urine, EKG's during rest and after exercise, x-ray films of thoracic organs and nasal accessory sinuses, and conducted vestibular and other functional tests. In some cases, spinal x-rays, pressure chamber exposure, etc., were conducted.

Rejections during the first examination phase were high. The main reasons for rejection were ear, nose, and throat ailments, neurocirculatory dystonia, and vestibulo-autonomic instability.

During the stationary phase, an expanded program of clinical, physiological, and specialized tests was used. From 25 to 50% of the candidates who had passed the first phase of examinations were rejected. The main causes of rejection were diseases of internal organs (nearly half the rejects), vestibulo-autonomic instability, ear, nose, and throat diseases, and spinal disorders.

Page 2 / 3

L 11364-67

ACC NR: AT6036509

In recent years, rejection of candidates during the second phase has declined as a result of a more detailed examination during the first phase and new methods of examination. For instance, substitution of the standard OR-10 vestibular test with I. I. Bryanov's test (summation of vestibular stimuli during Coriolis accelerations) significantly decreased the number of rejects due to vestibular disorders. At the same time, ear, nose, and throat rejects were more accurately diagnosed by substituting otoscopy and manometric examinations (Boyachev and Gerasimov manometers) with pressure chamber tests. Spinal x-rays during the ambulatory phase could not be justified.

The occupational activity of a number of candidates produced some changes which precluded their further participation and caused their rejection from testing work. About 10% of the candidates were found to be unsatisfactory during this phase.

These data permit the examiner to foresee probable deviations in health under occupational conditions during the selection phase, to evaluate individual methods applicable to selection, and to prognose work capacity under the influence of external factors. (N.A. No. 22; ATD Report 66-116)

TITLE : Stubble Forage Grain Crops in Chuysk Valley, Kirghiz SSR

ORIG. PUB.: Uch. zap. Biol. fak. Kirg. u-nit, 1957, vyp.8, 47-55

ABSTRACT : Results of a study (1955-1956) to choose forage crops (corn, barley, and oats) and proper varieties for stubble planting in the Chuysk Valley. When corn is planted as a post harvest crop on irrigated Sierozem its vegetative time is shortened, and it begins to bloom earlier. Waxy stage grain was obtained only from the early varieties Chakinskaya zhemechuzhina, Geo corn, Northwestern, and Grushevskaya. Varieties Sterling, Liming,

Theory of Functions of a Real Variable

Dissertation: "A New Concept of the Integral." Cand Phys-Meth Sci, Khar'kov
State U, Khar'kov, 1953. (Referativnyy-Zhurnal -- Matematika Moscow, Mar 54)

SO: SUM 213, 20 Sep 1954

16(1)

AUTHOR: Yaroshenko, N.S. (Pol's'ya)

SOV/41-10-4-10/11

TITLE: On a New Integral Notion and its Application to the Integral
of Stieltjes (Ob odnom novom ponyatii integrala i yego
primeneniye k integralu Stieltjesa)

PERIODICAL: Ukrainskiy matematicheskiy zhurnal, 1958, Vol 10, Nr 4,
pp 450-462 (USSR)

ABSTRACT: The author joins the integral notion of Kolmogorov [Ref 1],
especially the idea that the representation of the integrand
as the product of a point function and a set function is an
unnecessary restriction. Starting from this idea the author
defines a generalized Stieltjes integral, formulates the
conditions of existence, and proves the principal properties.
An example shall confirm the multability of the introduction
of the new notion. The paper contains 12 theorems, 4 lemmas,
and 5 definitions altogether.
There are 4 references, 3 of which are Soviet, and 1 German.

AUTHORS:

Vakhrameyev, V. A., Yaroshenko, O. P. SOV/20-123-5-43/50

TITLE:

The Upper Jurassic Flora of the Southern Regions of the USSR
(O verkhneyurskoy flore yuzhnykh rayonov SSSR)

PERIODICAL:

Doklady Akademii nauk SSSR, 1958, Vol 123, Nr 5,
pp 925 - 928 (USSR)

ABSTRACT:

Macro-remains of Jurassic flora rarely occur in the Ukraine, Crimea, Caucasis, and Middle Asia (Srednyaya Aziya). Even where continental sediments are prevalent (Middle Asia) only one locality rich in fossil flora is known: the villages of Galkino and Mikhaylovka (southeast end of the Karatau Mountain Range) (Refs 2,8-10). The rocks which contain this flora are assigned to the Lower Jurassic on the basis of Lower Jurassic plants (Ref 10). On the contrary, the finely bedded, limy shales, containing plant, fish, and insect remains, were considered as Middle (Ref 6) and even Upper Jurassic (Ref 2). Since the well known Upper Jurassic leafy plant remains of the southern part of the USSR are lacking, elimination of this uncleanness was impossible. In spite of previous unsuccessful attempts to extract spores and pollen, the authors

Card 1/3

The Upper Jurassic Flora of the Southern Regions of the USSR SOV/20-123-5-43/50

were successful, (sample donated by A. I. Turutanova-Ketova, village of Mikhaylovka). The pollen consisted of 94.6% *Brachyphyllum* (of various species, Fig 1), and 5.4% *Pinaceae* and *Cupressaceae* together with rare *Coniopteris* spores. The authors compare this with similar pollen assemblages of the USSR (Refs 1, 3-7, 11,12). They arrive at the following conclusions regarding the age of the calcdolomites of Karatau: 1) They belong to the Upper Jurassic according to O. P. Yaroshenko. 2) The firn and *Ginkgoaceae* declined strongly around the boundary between the Middle and Upper Jurassic and were replaced by an abundant development of conifers with awl or scaly formed needles. At the same time *Bennettites* with leather-like leaves developed. 3) The origin of these floral changes may be found in the dry climate, which prevailed over southern Europe, Kazakhstan, and Middle and Central Asia during the Upper Jurassic. 4) In the regions of Eurasia farther to the north (Ref 1), a distinction between the flora of the Middle and Upper Jurassic is scarcely recognizable; there, the climate remained moderately warm and damp. 5) In this connection, a study of the Upper Jurassic spore-pollen

Card 2/3

assemblages of southern Europe would be of interest. There
are 1 figure and 12 references, 10 of which are Soviet.

Title : On the Question of the Genesis of the Vegetation and Soils
of the Khankay Lowland Plain ravninaOrig Pub : Vopr. sel'sk. i lesn. kh-va Dal'n. Vostoka, No 1, 1956,
17-28.Abstract : Drainage of the surface of Khanko Island is followed by
the appearance on the surface of a peculiar complex of
swamp and swamp-meadow vegetation, peat-gleyey and turf-
gleyey soils. As the area dries out this vegetation is
replaced by more xerophilous meadow and steppe groups.
Then the grass patterns of the upper terraces are replaced
by oak forests; the soils formed under these are similar

to gray forest soils, or rather to gray-brown forest soils.
The extended influence of the dry gap-meadow and steppe
vegetation leads to the formation of dark-colored soils
which the author calls meadow-steppe soils. These soils
are characterized by their high humus content, their struc-
ture /strukturnost'/, and their high content of metabolic
Ca and Mg. The project was completed in the Far-Eastern
Branch of the Academy of Sciences USSR.
